TenCate Advanced Armour provides customised lightweight protection solutions for use in ships. Naval armour is used to protect mission-critical areas on board, including ammunition magazines, bridge stations, combat information centres, communication equipment and weapon systems.

Our protection solutions are tailored to meet user requirements for either permanent integration into the structure of a new vessel or for additional protection of existing ships. Naval vessel armour can be customised to tackle individual project specifications, so that it fits specific requirements.

The protection level provided can be from NATO STANAG 4569 level I to VI, or to comply with specific customer requirements.

Our projects include the two Danish support ships Absalon and Esbern Snare, which are protected with armour panels designed and produced by TenCate Advanced Armour.

TenCate Advanced Armour makes full use of the most advanced composite technologies currently available. We take the ultimate in materials technology, know-how and scientific studies of ballistic impacts and mould these

into products and solutions that deliver the best possible protection and maximum survivability for equipment and personnel.

TenCate Advanced Armour is a global supplier of advanced composite materials for a wide range of applications such as protecting personnel, vehicles, aircraft, and naval vessels against an extensive range of threats and dangers.

Military, security and law-enforcement professionals need to know they have got the most effective protection available.
