At Weibel Scientific, we have one overarching goal – to continue delivering the world's best and most advanced Doppler radars. Weibel radars are used globally to protect lives and assets on the ground, at sea, in air, and in space. For almost 40 years, we have developed and delivered cutting-edge velocity and position-measuring instruments to customers all over the world. We count numerous governments, public organizations and international conglomerates among our customers, and we offer our expertise to the NATO missile defense, NASA, and

other international space agencies. With an experienced and innovative eye for business and technology, Weibel Scientific's management and staff have taken the company to where it is today: the global leader in the market for advanced Doppler radars.

### Obsessed with perfection

Weibel Scientific is a research company with a very specific and deep knowledge of one product: the Doppler radar. We continue to develop this in all its different configurations and will not be satisfied until we reach

the limits of physics. At Weibel, we are obsessed with perfection and this is one of the reasons behind our significant growth. When we are searching for new technological solutions, nothing is impossible until it has been proven otherwise – and even then, we will try again. This approach propels the development of our radars forward

### Extreme service

Weibel delivers the world's highest quality and most advanced Doppler radars – on time and every time. We strive to make sure that each radar system attains the highest

## All Weather Radar Systems

Only the laws of physics limit the possibilities of our radar systems.

quality possible and nothing less than 100% customer satisfaction is good enough for us. And customer care extends far beyond the actual sale of radar systems. From initial contact to after-sales support, we take pride in providing excellent service. We always go the extra mile for our customers, and we never give up.

Although we are a company with a long history, we are continuously defined by a deep-seated entrepreneurial spirit. Fast decision-making is part of the Weibel DNA and we take pride in diminishing administration and bureaucracy. This

makes us more agile than most companies in the market and it allows us to focus on the needs of our customers before focusing on our own. We work closely with our customers because their mission is our mission and their business is our business.

### Insourcing

We are simultaneously a local and global contender in the marketplace and take our responsibilities seriously. We have insourced all development and production to our headquarters in Alleroed, Denmark, invested over \$50 million in research and development, and

built strong trade relationships and friendships through our businesses around the world.

In short, we have a pedigree of building very precise measuring systems. From that, we have evolved the technology into numerous products for naval applications. We produce muzzle velocity radars for naval guns, fire directors for naval platforms and guns, unique surveillance and tracking radars, and long range discriminating radars for ballistic missile defence. And much more. We hope you will allow us to make your mission our mission, too.
